

Subluxations and Bailey Chiropractic Centre of High Point, NC

A subluxation, or more precisely, the Vertebral Subluxation Complex, describes what happens when spinal bones lose their normal position and motion from stress, trauma, or chemical imbalances. Automobile accidents, improper lifting, alcohol, emotional stress, chemical imbalances, and long periods of sitting can cause the Vertebral Subluxation Complex.

Vertebral Subluxation Complex and the Chiropractor

This is a serious condition identified by its five parts:

Spinal Kinesiopathology:

This is a fancy way of saying the bones of the spine have lost their normal motion and position. It restricts your ability to turn and bend. It sets in motion the other four components.

Neuropathophysiology:

Improper spinal function can choke, stretch, or irritate delicate nerve tissue. The resulting nervous system dysfunction can cause symptoms elsewhere in the body.

Myopahtology:

Muscles supporting the spine can weaken, atrophy, or become tight and go into spasm. The resulting scar tissue changes muscle tone, requiring repeated spinal adjustments.

Histopathology:

A rise in temperature from an increase in blood and lymph supplies result in swelling and inflammation. Discs can bulge, herniate, tear, or degenerate. Other soft tissues may suffer permanent damage.

Pathophysiology:

Bone spurs and other abnormal bony growths attempt to fuse malfunctioning spinal joints. This spinal decay, scar tissue, and long-term nerve dysfunction can cause other systems of the body to malfunction.
